Patent No. 6723700
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Blaschuk, Orest W.
APPLICANT: Gour, Barbara J.
TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING CLAUDIN-MEDIATED
TITLE OF INVENTION: PUNCTIONS
FILE REFERENCE: 100086,409C1
CURRENT FILING DATE: 1999-03-30
NUMBER OF SEQ ID NOS: 480
SSEQ ID NO 470
LENGTH: 30

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence (Sequence 1 Sequence 1 Sequence 1

                                                                                                                                                                                                                Sequence 470, Application US/09434355A
Patent No. 6830894
GENERAL INFORMATION
APPLICANT: Blaschuk, Orest W.
APPLICANT: James Mathew Symonds
APPLICANT: James Mathew Symonds
APPLICANT: Gour, Barbara J.
TITLE OF INVENTION: COMPOUNDS AND METHODS FOR MODULATING CLAUDIN-MEDIATED
TITLE OF INVENTION: FUNCTIONS
FILE REFERENCE: 100086.409C2
CURRENT APPLICATION NUMBER: US/09/434,355A
CURRENT PILING DATE: 1999-11-03
NUMBER OF SEQ ID NOS: 531
SOFTWARE: PATENTIN Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Patent No. 5556744
GENERAL INFORMATION:
APPLICANT: Weiner, David B.
APPLICANT: Williams, William V.
TITLE OF INVENTION: Methods and Compositions for Diagnosing
TITLE OF INVENTION: and Treating Certain HIV Infected Patients
NUMBER OF SEQUENCES: 197
                                                                                                                                        3;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ribulose-bisphosphate carboxylase (EC 4.1.1.39) large chain - kidney bean chloroplast (fricibulose-bisphosphate Phaseolus vulgaris (kidney bean)
C;Species: chloroplast Phaseolus vulgaris (kidney bean)
C;Species: chloroplast Phaseolus vulgaris (kidney bean)
C;Species: charce: change 09-Jul-2004
C;Accession: S68880
R;Yoshida, T.; Minamikawa, T.

DNA encoding kidney injury related molecule - which is upregulated in injured or rejenerating tissue, useful to promote growth of new tissue and survival of damaged tissue.

Claim 9; Page 46-47; 68pp; English.

This protein, designated kidney injury related molecule (KIM), is upregulated in injured or regenerating tissue. Its amino acid sequence was deduced from a clone (see AAT96035) obtained from a human embryonic liver library. A 572-amino acid (see AAW38335) and a 307-amino acid rat KIM (see AAW38334) are also claimed. Recombinant KIM polypeptides can be expressed in prokaryotic and eukaryotic host cells using a claimed process. Soluble variants fused to a toxin, imageable compound or radionuclide, and IgG fusion proteins are also claimed. KIM, or an agonist, can used to treat renal disease and to promote the growth of new tissue or the survival of damaged tissue, generally in conditions where the binding of specific ligand to KIM stimulates cell growth, maintains

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel antibody, antibody derivative or antigen-
binding polypeptide that inhibits proteolytic release of a soluble
kidney injury molecule-1 (KIM-1) polypeptide from KIM-1-expressing cells.
The antibody, antibody derivative or antigen-binding polypeptide is
useful for treating or preventing renal disease or injury, e.g. renal
cancer. The antibody is also useful for inhibiting shedding of the KIM-1
polypeptide. This sequence represents a protein relating to the KIM-1
protein of the invention
cellular differentiation or reduces apoptosis, e.g. in cases of renal failure, nephritis, kidney transplants, toxic or hypoxic injury. A monoclonal antibody specific for KIM can be used to treat renal disease, e.g. where binding of KIM to light aresults in neoplasia, loss of cellular function, susceptibility to apoptosis or promotion of inflammation, deliver imaging agents to KIM expressing cells in vivo or lan virto and measure KIM concentration by immunossay.

Damage/regeneration of renal cells can be determined by measuring KIM, particularly to diagnose or monitor the progress of disease or therapy. KIM-expressing tumour cells can be inhibited by treatment with a fusion protein comprising KIM ligand or Mab with a toxin or radionuclide, and tumour cells that express KIM ligand can be inhibited with similarly tagged KIM or anti-KIM ligand can be inhibited with similarly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antibody, antibody derivative or antigen-binding polypeptide that inhibits proteolytic release of a soluble kidney injury molecule-1 polypeptide, useful for treating or preventing renal disease or injury,

The present sequence is that of human kidney injury molecule-1 (KIM-1), a type I cell membrane glycoprotein and member of the T cell immunoglobulin (Ig) and mucin domain (TIM) family. This protein has 334 amino acids or 359 amino acids AD076690, depending on splice variation. It has been discovered that treatment of a mammal with a KIM-1 antagonist alters the interaction of T cells and other immune system cells, e.g. dendritic cells, monocytes, macrophages and B cells, and thereby strongly suppresses an IgG response to an antigen. Such treatment also eliminates IgG1 production by memory B cells in response to subsequent challenge
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "C-terminal region unique to this splice variant"
